

## The destiny of man

The destiny of man.  
where we are.

And where we are going tomorrow and the day after.

This small planet Earth, is fast becoming over crowded and over used, because of our success, it is said that success breeds success, and if that thought holds true, then there is hope for us after all,

modern man have educated himself, and in the process, he has made himself very comfortable in deed, and in the process of making himself comfortable, he had to destroy some of the things that have kept us alive for all these years, but there is a trade off, because he have added some thirty years to his life span, so as a result, we are milking the planet dry, and before long, we will have to squeeze very hard, in order to get anymore out of this lump of rock, and the time is fast approaching, when we will not be able to get not one more drop of life out of the planet.

The desire to copy and duplicate, or mimic, have forced the underdeveloped countries to strive to catch up to the develop countries, now we are all fighting, metaphorically speaking for the same product or goods, this in it self, is taking us all down the road to disaster,

and try as we may, it is now too late to stop the race, because any country that slows down, or fall behind, is laugh at, and made to feel unimportant, now pride in self, and country, will force the country in question to disregard logic and common sense, and rush headlong into the obis, and the word at the head of every memo, that is written to the minister responsible for the image of the country in question is PROGRESS.

Progress is blamed for, or used as an excuse for the destruction of our beloved planet, can this situation be turned round, no, because every man believe that he or she is as important as the next man or woman, so we can either share the planet, or we will all go down together, sad, but that is where we are at the moment.

Now the question is, will we admit that we have gone too far, and if we do admit where we are, will we all put our heads together, and try to find a new home if we are to continue as a species, and go on to bigger and better things, and hopefully, learn from this life that we have made for yourself, god I hope so.

Debris from MARS, will some day fall away and some of this debris will hit this small planet, the SUN will also expand and the heat on this planet will be unbearable, weather we like it or not, we will some day have to leave this planet, and find another planet which is more safe, and much larger if at all possible.

For the people who say, that my expressions are depressing, must remember the numbers, and when you multiply 300 by 700 you may come up with 2.1 millions, and that is only a fraction of the number of people living on the planet at the moment, and every day a bucket full of babies are born, so you work out the numbers, and just one more thing, they all have the right to live just as you or I do, so what are we going to do about the numbers,

will we see a time, when a committee will be formed to determine who will live and who will die, even in CHINA to day, the government is as we speak, trying very hard to control the numbers of babies born, because the government of CHINA, is looking ahead, as we all know that prevention is better than cure, but will the sick and the disable be put to sleep, and if that does not work, will the committee then turn to the people who cannot defend them self , will we see a day, when your race determine weather you live or die, good question, but I do not have the answer for that one, but a decision by the committee who is charged with the responsible to sort the mess out, will have to be made, and if that does not work, what then?

Let us face the facts, the killing would have to stop, because the unskilled task would still have to be done, and the people in charge hands are too soft.

We are still left with too many people, and too few goods or food to feed the people on the planet,

In the winter months, the people have to be kept warm,

In addition, in the west, most people will still want their air condition,

It takes energy to keep warm, and likewise, it takes energy to keep cool, there is no way out, and there is no short cut, so we will have to find a new way to live, or change the way we now live, and we do not have a choice in the matter.

Now let us get back to the question of a location change, and the need to search the stars for our next home, some things we do for fun, and some things we do just to pass the time, but this time, we are looking for a new home, to per long the life of the species, this is no joke, the necessity to relocate is now official we must.

New question, how are we going to do this thing, and how are we going to leave the planet, and what type of craft are we going to use, now that the question have been asked, The next task is to find a design, that will fulfill the demand that will be placed on this wander craft, that will take the people of planet EARTH, to this now home in the stars.

All the wise men of the planet will have to put aside their differences, and put their heads together and work as a team, because we are all in the same boat.

Over the years, we have been using a strange shape, or a bullet type looking rocket to search the stars that shape and our approach to space travel will not do the job, a new way will have to be found, part of the reason for the shape that we use today, is a direct result of our ability, or lack thereof, we as a people have got stuck in a mode of thinking, and because we are stubborn too, we are reluctant to change, but the old saying that necessity is the heart of invention, may and will some day save us.

The shape and type of ship that man will have to use to leave the planet, and search the stars, will be a simple shape to look at, and more than likely it will look like a disk, and it must be able to take five thousand people at one time, and the knowledge to build this ship must, once perfected, the knowledge must be passed on to every nation on the planet, if we all are going to survive and continue the species.

The energy that we will be using to power this craft, will be an antigravity engine/electromagnetic, and the computer that will control this ship, will have the past history and up to the present knowledge, of man in the data base, and all the known facts that we now have will also be in the computer's data base.

Now we record and keep only the things we can see, and if we have not seen it, We say it does not exist; this mode of thinking must stop.

At this moment in time we speak of dimension, and dimensions, I myself think that there are many dimensions, and one of the main reasons why we as a species have not been given the ability, to work in any other dimension than the one we now know, is because we as a species have not progressed beyond the need to kill each other, and we are a little destructive to say the least.

Men on planet EARTH have been programmed to think that you cannot have life without the presence of water as we know it, or some form of liquid, and to stress the point, how many forms of liquid do we know of.

We are speaking of life as we now know it, but who is to say that life can only exist in the form that we know, if you have an open mind, and are willing to speculate, then the possibilities are endless, and the form that life may take would, and probably beyond our imagination at the moment.

Take the bombardier beetle for one, this beetle crawls along the forest floor, and for a very long time,

there is a frog that would like very much to make a meal of this beetle, but every time the frog sticks its tongue out and snaps up the beetle,

The sudden darkness makes the beetle react in a strange way, the beetle has in its body, two chemicals that when mixed, creates an explosion, and the frog immediately spits out the beetle, that is something it is not.

This beetle lives on planet EARTH, but not many people know about it, if this beetle lives on the planet with us, and possesses the ability to protect itself using chemicals,

Just stop and think for a moment, what could be waiting for us in outer space, so the idea that we could attempt to guess on the type of life we may find in outer space, is a little misguided at best, and foolish at worse.

Another strange life form sprung to mind, and that is the caterpillar which turns into a butterfly,  
in it's first life it is a caterpillar, and in it's second life it becomes a butterfly, we see this every day and yet some of us are still of the impression that we are alone in the universe, and that we are on the top of the food chain.

Many things are possible if you have the right mix, visibility plays a big part in our ability to feel comfortable, the unknown leaves one feeling somewhat unsafe, during the winter months when the fog comes down in the valley, and visibility is down to fifty feet, although you use that road every day for the last fifteen years,

You feel unsafe because you do not know what is beyond the fog, you feel unsafe because you do not know what is beyond the fog that you cannot see.

Now let us go back to the subject of space and the solar system, we at the moment can only see so far, so we do not know what is beyond the stars, we can do one of two things, one we could leave well alone, and two we could investigate what is beyond the stars, the latter action is a must, because we are going to run out of space and food on this planet before long.

The fear of the unknown have kept us behind the line of discovery for a long time, but the necessity to survive will force us to step over the line, if only we know what was out there, but I will speculate that everything that we now have on planet EARTH can be found in outer space, nature tends to always duplicate itself, and I also think that nature always have a test run before it completes a job,

On planet EARTH there is two of every thing, one positive and one negative, I sometimes here people say that there is light and there is darkness, or that the night is black, but there is no way you can see the dark, the dark is just the absents of light,

Therefore, so it is with outer space, we now fly around in space looking at a few burnt out lump of rocks, and we think that we are space explorers, we are nothing of the kind, and we dabble a little, and we test a few sensors, but we need to think on a grander scale if we are to achieve anything meaningful.

We are lucky enough to be given an opportunity to observe some of the wanders of the universe, right here on planet EARTH,

but we tend to overlook some of the markers that we were given,

take the sea for one thing, just for the moment think of the many types of living creatures in the sea, and nearly all of them uses a different type of hunting tool, some of the creatures don't even look as if they are alive until you disturb them,

and like I have said before, your environment determine how you look and how you move about, some life form just sit and wait, and some are born hunters, the hunter are less skilful than the ones that just sit and draw their pray to them, the sitters study the music that the pray like to here, and all the sitter does, is to play the music and they will come a running, that is so cool, don't you think.

Space seams cold,

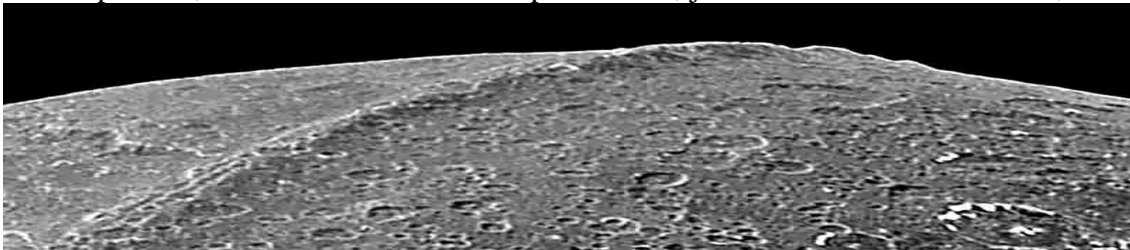

and when you are away from the sun it seams dark, remember the absent of light make it seams dark, but we call it dark because we don't know what else to call black energy, so it

would be right to say that the other side of light is black energy, some life form needs the absent of light to survive, and some life form like us for the most part needs the sunlight to function at our best, not too much light and not too much black energy.

I am now going to go a little wild, and if it gets too rough for you, I will understand if you stop reading, so here goes, I think that some of the objects we see in the universe were made by some life form, because if gravity plays such a big part in our survival, then look at the distance between some of the planets, one inch either way and there would be a disaster,

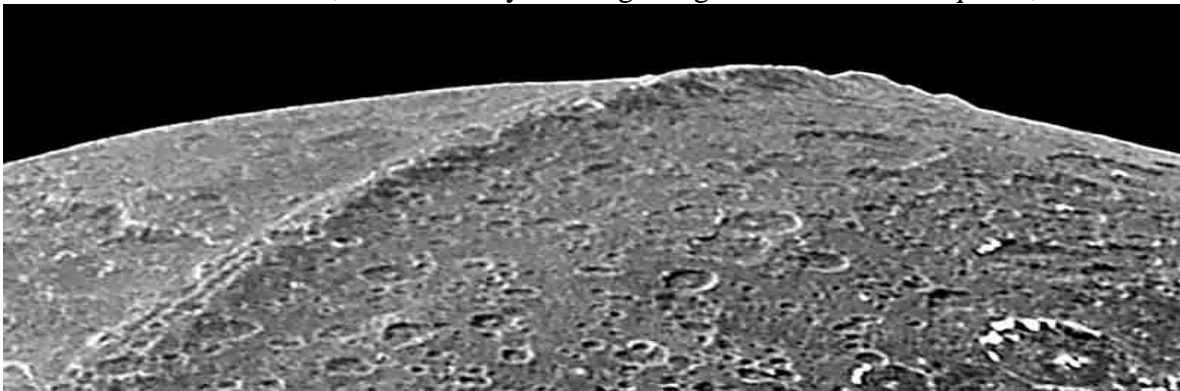

One gets the impression that someone sat down and worked out the numbers, and it was done for our protection.

The MOON, the SUN, I will now leave a space for you to think for a moment, ok you have thought, I will go on, if we take a string and tie it around the sun and start to pull it in our direction, at what point would it kill us, and likewise if we do the same thing to the moon, at what point would it block out the sun, and kill us in another way, are you with me so far, ok, some things in the universe are where it is for our safety, we should go by and have a look, and maybe pick up a few tips, but the close ones are not to be colonized, it is the ones farther down the road we should be looking at, because they are at a safe distance away from space traffic, if you understand my meaning, if you cook something long enough, all you are left with is soup, and if you burn something long and hot enough all you are left with is powder, I mention earlier about space traffic, just take a look at this below,

This is a result of space traffic, you would not want to be standing in the yard when these babies were falling, take another look at what space traffic could do to your well-manicured garden, and by the way,

I think that this was made, note the sixty mile high ridge around it at the equator,

(C) 2005 The Enterprise Mission

This I just put in for fun, but I think that you get the idea. We talked about the need to find a new home for humankind, because of our success so far on this planet, I should qualify that statement by saying success in objects made, but we are not successful in our respect for human life, this is really strange, Because here we are trying to prolong the existence of the species, and yet we have no respect of the species of man, I suppose while there is life there is hope. The next chance we get as the human family we must promise our self, that we will not interfere in other people's business, because all that has brought us is death and destruction, and enough of that already, so if we as a species are going to do this thing, we will have to start practicing to live right now, because when we get out into space it will be too late, and there may be some other species out there bigger and meaner than we think we are, so we can't be going out there puffing out our chest like we do on planet EARTH.

In addition, to bring our demise much sooner, telling them that they will have to adopt our ways, and totally disregarding the fact that these people whoever they are, Have been living like that for say one hundred millions years.

We will have to drop the old ways and adopt the new, which is mind your business, and leave people alone, and you too will be left alone.

There is more to be said and in time it will be said, if not by me but by some one else, look up and think big, don't look close look far and keep an open mind, and who knows we may even make it.
